

Isotope Bone Scan

Nuclear Imaging Department Radiology

Introduction

This leaflet tells you about having an isotope bone scan. It explains what is involved and what the possible risks are. It is not meant to replace informed discussion between you and your doctor.

What is Nuclear Imaging?

Nuclear Imaging is a way of imaging different parts of the body using a small amount of radioactive isotope attached to different chemicals. These radioactive isotopes give off gamma rays which are similar to X-rays.

A gamma camera is used to detect these rays and produce an image on the computer. Unlike ordinary X-rays, nuclear imaging can be used to show how well an organ is working as well as what it looks like.

The radioactive isotope is normally given as an injection into a vein but can be inhaled or swallowed depending upon the test.

What is an isotope bone scan?

An isotope bone scan allows the imaging of the activity of the cells within the bones.

The liquid radioactive isotope used in this test has to be given as an injection into your arm or hand. It is then absorbed by the bones over a period of 2-4 hours, after which time the images will be taken.

Certain scans may require you to have images taken at the time of your injection as well as later in the day.

After your injection you will be given a time for your images to be taken. If you are an outpatient, you may leave the hospital until this time if you wish, however, there is a waiting area for you to use should you want to stay and use the onsite shops/café.

If you stay in the department you should use the specific toilet for Nuclear Imaging patients but if you leave the department you may use any one.

Is there any preparation?

No, you can eat, drink and take any medication as normal.

After the injection you will need to drink more than usual, about 2 litres over the rest of the day and will probably need to empty your bladder more frequently.

The prevention of infection is a major priority in all healthcare and everyone has a part to play.

- **Please decontaminate your hands frequently for 20 seconds using soap and water or alcohol gel if available**
- **If you have symptoms of diarrhoea and/or vomiting, cough or other respiratory symptoms, a temperature or any loss of taste or smell please do not visit the hospital or any other care facility and seek advice from 111**
- **Keep the environment clean and tidy**
- **Let's work together to keep infections out of our hospitals and care homes.**

Can I bring a relative / friend?

Yes, but they should be over 18 and not pregnant.

Children under 16 years attending for a scan should be accompanied by a parent or guardian.

What if I am pregnant or breastfeeding?

If you are pregnant or think you may be pregnant you should inform the department before attending for your scan. Also, certain radioactive substances are excreted in breast milk. If you are breastfeeding you should inform the department so you can be advised of any special precautions.

What happens during the scan?

Prior to your scan you will be asked to use the toilet and empty your bladder. You do not have to undress for the scan but will be asked to remove metal objects such as keys or coins from your pockets and to take off any jewellery.

The scan is taken with you lying on an examination couch between the gamma camera detectors. The camera normally starts off over your head and after a short time the bed will move you out allowing the camera to scan down your body.

Following this first image the camera may be repositioned above you, but this time it will rotate around you to build up a 3D image of a specific area of your body.

How long will it take?

Please allow 30 minutes for the radioactive isotope injection (and initial images (if required)).

On your return the images will take approximately 40 minutes.

What are the risks?

Most things that we do in life or in medicine have a small risk and we want you to understand any risks involved. Please remember that we would not recommend this test if we did not think that the risks were outweighed by the potential benefits.

Radiation

The radioactive injection exposes you to gamma rays, which are a form of radiation similar to X-rays. We use as little radiation as possible. The amount used is similar to that in many other X-ray or nuclear medicine scans; it is the same as a few years worth of the natural background radiation to which we are all exposed.

As a precaution, following your injection and for the rest of the day, we ask that you avoid prolonged close contact (over an hour at less than one metre) with any children or pregnant women. This is to avoid them being exposed to unnecessary radiation.

Are there any side effects?

The injection does not cause any side effects, nor will it make you sleepy. You will still be able to drive and carry on with any normal activities.

When do I get the results?

We cannot give you the results of the scan on the day you attend.

The scan will be reviewed and a written report sent to the Consultant / GP who referred you. Your consultant will then arrange a follow up appointment to discuss the results of your scan.

What should I do if I have a query about my appointment?

If you have any queries about your scan or wish to alter the appointment please contact the department on:

01902 307999 ext. 86347

Monday – Friday, 9:00am – 4:00pm

If you need an interpreter, please let us know and we will arrange one for you.

Please note that in view of patient confidentiality, we are unable to discuss any details concerning this appointment with anyone other than you.

Where can I get further information?

Websites:

For general information about radionuclide tests, visit The British Nuclear Medicine Society website: www.bnms.org.uk

If you wish to know more about the radiation used in medical examinations information can be found on the Public Health England website: www.gov.uk/government/organisations/public-health-england

Radiology Department

The Nuclear Imaging department is on the 2nd floor of the Radiology Department.

The Radiology Department is situated off the main hospital street close to Greggs.

A site map can be found on the reverse of your appointment letter.

Transport Information

Zone A: A2 Radiology Department

The nearest car parks are P5 and P6. Please allow time to park as our car parking areas may be busy. Car parking is "pay as you leave". There are designated spaces for disabled.

Public transport:

Details of the buses serving to the hospital are on our website:

www.royalwolverhamptonhospitals.nhs.uk

English

If you need information in another way like easy read or a different language please let us know.

If you need an interpreter or assistance please let us know.
